4: Landor T-5 (ca. 1890) 1893 AB6 Ainu AB6

rivers where fish is abundant, as in the Yezo watercourses. The Ainu at Frishikobets took very kindly to sitting for their portraits, and one after the other—all the best types—were immortalised either in oils or in pencil. Strange to say, I came across another old woman, a lunatic, very similar to the one I saw at Yammakka. Her face was that of a witch, her eyebrows joining downwards somewhat in the shape of an owl's beak. Her long pale hands and face, and the long wild hair covering half her face, gave her a striking appearance. She had, however, not yet reached the stage of imbecility which her Yammakka sister had attained. Lunacy is very common among the Ainu, and the unfortunate creature thus afflicted seems to lose not only the respect, but also the pity, as well as care, of all the others, and is treated by them as a worthless animal.

After crossing the Frishikobets River, some distance off, on the east side of the Tokachi River, are the villages of Uparpenai,[1] twenty-one Ainu huts, Memuro-puto,[2] sixteen huts, and Ottoinnai,[3] fourteen huts. Then comes Kinney, with seven houses; and finally Nitumap,[4] the last village on the Tokachi River, has as many as thirty-six houses.

The huts of the Tokachi region are much smaller than those on the Saru River, and near many of them is a cage, in which a big yellow or black bear is confined. The natives told me that yellow and black bears were numerous in the neighbourhood. Deer (the *yuk*, male deer, and *mowambe*, female), were formerly plentiful, but now are very scarce. A few years ago a pestilence killed great numbers of them, and since then they have dwindled away.

Not many miles from Frishikobets a huge cliff rises perpendicularly along the Shikarubets River. A landslip seems to have taken place, which leaves one side of the cliff perfectly bare and rugged, showing the strata composing the soil. It is of a light yellowish colour, and it is called by the

[1] *U*, place; *par*, mouth; *pe*, undrinkable water; *nai*, stream; *Uparpenai*, a place at the mouth of a stream of undrinkable water.

[2] *Me*, in front; *mu*, sheltered spot in a river; *ro*, track; *puto*, mouth of river; *Memuro-puto*, track in front of a sheltered spot at the mouth of a river.

[3] *Otto*, into; *i*, a place; *nai*, stream; *Ottoinnai*, a place in a stream.

[4] *Nitumap*, open trunk of a tree.

their quarrels and difficulties, which they are asked to settle. Thus, because of these qualities necessary for the office, these chiefs are a slightly superior type to the other natives; for with savages, as with civilised people, sharp-witted, strong, and brave men are naturally of a finer type than those who are their inferiors in these qualities: but the difference among the best Ainu and the worst is so small that I do not feel justified in classing chiefs as of a different caste. Besides, exceptional beauty, strength, or larger stature is not necessarily transmitted in the families of chiefs, nor do the Ainu themselves consider them better-looking than others.

As Ainu laws of marriage have no relation to the physical and moral improvement of the race, the only way of classifying the natives for purposes of heredity is by tribes, each village being considered as a tribe. Ainu villages are generally very small, and the inhabitants of each village intermarry among themselves, therefore each member of the community is in some way related to every other member; hence heredity in certain physical traits, mental qualities, and diseases shows itself in one community and not in another. The difficulty of tracing the exact connection of each individual with his or her relations beyond the acknowledged father and mother also baffles research in more minute details. Abnormal formations are sometimes transmitted to many members of one tribe, as, for instance, the hare-lip and webbed fingers, of which deformities two or three specimens could be found in a small village numbering fifteen or twenty houses. Malformation of the umbilicus is common—sometimes in almost every member of one small community—while it is very rare in others. Children are mostly affected by this, as in some villages the cord is not treated at all at birth; and this leads to an abnormality till the child grows older, when the few who survive seem to get all right. In other villages the cord is fastened in a very primitive, not to say imperfect, manner, with a common string of *Ulmus campestris* fibre.

Albinism is very uncommon among the Ainu. I do not know of any case when it has been transmitted, as albinos are greatly disregarded by the Ainu, and, I was told, seldom marry.

Red hair, or hair with red shades in it, is common among

4: Landor T-5 (ca. 1890)1893 AB6 Ainu AB6

563 The head is in most instances of an abnormal size; the frontal
142 bone is generally more sloping than with the thoroughbred
732 Ainu; and though the skull be wide from one temple to the other, it is not spacious enough from the frontal bone to the back of the head. They have heads so shaped that the animal propensities are in excess of the moral and mental faculties. In thoroughbred Ainu I found the bumps of amativeness, philoprogenitiveness, and tune very well developed. In the half-breeds these bumps hardly show at all, and in some cases the back of the head—where the two first bumps are found—is almost flat.

563 "Ainu half-breeds never live to be very old. They are often
164 affected with rheumatism—*kaki*, a disease peculiar to the Far East—leprosy, and consumption, and they suffer from these diseases much more than do the pure Ainu. I found leprosy quite common among half-breeds—while I have seen but few Ainu affected with it. In most instances, though, leprosy had only attained its first stages—contraction of fingers and subsequent dropping off of the three phalanges, ears, and nose; but this may be explained by the fact that the sufferers in general succumb before the disease attains its more serious character, when the whole body is visibly affected by it."

153 Precise laws as to the degree of quickness of perception, power of reasoning, and learning of the Ainu race cannot be given, for, as I have mentioned before, almost each individual would require a special rule for himself. My readers may have noticed that, while some Ainu were but little above monkeys, others were sharp, and gave answers very much to the point. This may apparently be regarded as a contradiction on my part by people who have neither lived with savages, nor studied the temperament of beasts. But it is not a contradiction. There are in this world clever monkeys and stupid monkeys: some can never be made to learn any tricks; others will learn them in no time. Intelligence is instinctive, and not acquired, though of course it can be greatly developed with education; thus, the Ainu are instinctively intelligent, but I wish my readers clearly to understand that their intelligence does not go much further than that of an intelligent monkey, though of course the Ainu have the advantage over beasts of being able to talk, and therefore, to a limited

/763 cont./

843 562 Even during pregnancy the woman enjoys a certain amount of attention and care. I was able to observe that they showed indulgence towards a pregnant woman, that they helped her at work and quietly permitted her idleness and longer sleep.

843 Among the advice to pregnant women especially noteworthy is the rule that recommends that they move around a lot. In this way the fetus is supposed to remain small and the parturition to proceed quickly and without special pains. The closer the moment of delivery, the more exercise the woman is to take. If she sits around much during her pregnancy the fetus becomes too large and the mother suffers several days before the birth is over.

732 843 807 825 A pregnant woman may not eat lobster since the child will then have a hare-lip. She may not eat the flesh of birds either because the child might then be born with squinting eyes which move like those of a bird. In this manner they explained to me a case of hare-lip of a woman in the village Nayero and of two crosseyed brothers in the village of Takoe.

843 789 883 886 Two months before birth a pregnant woman may neither spin nor wind string (from nettle fibres) because the entrails of the child might then get entangled like string. The same can also happen if the woman should want to twist wool.

844 Birth—During the birth a woman does not leave the house but remains in her usual place at the fire. All children, young people, and sometimes also grown-up men, on the other hand, are chased out of the yurt. For they hold the belief that a great number of spectators increases the pains of the woman, and they also consider quiet as very desirable. In order not to dirty the floor they cover the spot where the sick woman is to lie with twigs of fir and pine. They also give her a support of old clothes and a mat woven out of grass. The woman lies down on her right or left /764/ side with a belt clasped lightly around her, which is made of some kind of material, but not of nettle fibres since these are too hard. When the weather is cold the woman keeps her boots on but in the contrary case this is not necessary.
